Description

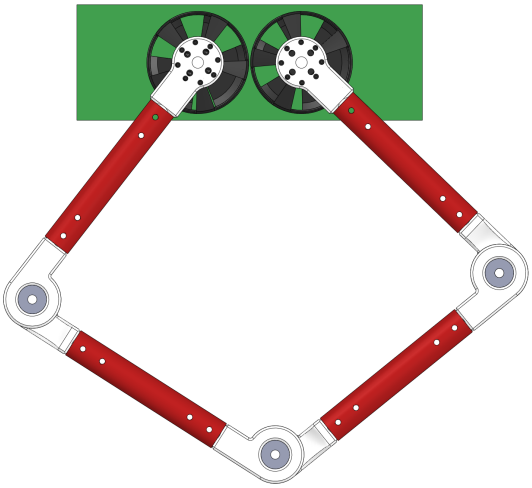

Figure 1: Version 1 of Baleka leg platform (Ben Bingham, 2016).

The Mechatronics Lab has recently developed a single leg, direct drive robot, Baleka, to investigate modelling and control of rapid accelerations. This project will involve the design of a control system to perform stable hopping with the robot. Various controller algorithms will be investigated and compared (eg. PID, MPC, etc.). The project will also involve developing a test rig for the robot.

Deliverables

- Mathematical model of the hopping robot must be developed in Simulink/Matlab
- Hopping controller design
- Mechanical design of the test rig
- Experimental testing of the robot

Skills/Requirements

- Mathematical Modelling
- Mechatronics Design
- Control Systems
- Embedded Systems
- Strong Practical and Mathematical skills required

ELO3: Engineering Design

Perform creative, procedural and non-procedural design and synthesis of components, systems, engineering works, products or processes.

The student is expected to design:

- Robot feedback control system
- Rig for testing of hopping motion

Area of Research

- Bio-inspired robotics
- Control systems
